Remote Sensing | ScienceDirect

Publisher Summary: This chapter discusses the influence of the sensor on remote-sensing measurements. Its primary impact is a local spatial and spectral integration of the signal by which the resolution of the image data are determined.

Special Issue "Remote Sensing based Building Extraction"

The proposed method achieves a total F1-score of 0.704, which is an improvement of 1.1% to 12.5% compared with the top three solutions in the SpaceNet Building Detection Competition and 3.0% to 9.2% compared with the standard U-Net based method. Moreover, the effect of each proposed strategy and the possible reasons for the building footprint extraction results are analyzed substantially.

Remote sensing images are normally in the form of digital images. In order to extract useful information from the images, image processing techniques may be employed to enhance the image to help visual interpretation, and to correct or restore the image if the image has been subjected to geometric distortion, blurring or degradation by other factors.
